

Mindful Learning – Phase 2

Learning Platform, Email & Chat

The learning platform, email, and chat will now be integrated to create a complete platform for both staff and students.

We would also like to automate certain processes so that the system can send automatic messages and reminders.

Sollentuna Students

Students who come to us through Sollentuna Municipality can make use of the municipality's support services.

The Learning Team, as they are called, provides different types of support for studies.

We would like an automatic email to be sent to all Sollentuna students informing them about the Learning Team.

Every time a new student from Sollentuna is registered, this information should automatically be sent after the admission email has been sent.

Document: folder-om-larteamet.pdf

Email / Chat

We want to keep all internal communication within the platform, as well as communication between the school and students.

It is important that students also receive a copy of messages by email, since some students may not log in every day.

Would it be possible to send messages to mobile phones in a similar way to healthcare services, where the recipient cannot reply but can see all the necessary information?

Chatbot

Our students often ask questions about information they have already received.

Would it be possible to integrate a chatbot that searches for relevant information and answers their questions?

Learning Platform

This is where all students will see their study plans and the course cards they are connected to.

Students should be able to click into active course cards to view lessons, read instructions, and complete assignments.

Teachers should also be able to provide feedback on completed assignments and see how students are progressing in their courses overall.

Course Template

Each course should have a ready-made template created by the administrators.

Permission can be granted to selected teachers so that they can create course templates themselves.

What is common to our templates today, with some exceptions, is that all templates contain 5 modules.

Each module contains 2 sections, although some may contain more.

Additional components are included in Module 3 (partial exams) and Module 5 (cases).

The templates are designed so that they can be duplicated when creating course cards for students studying with us.

Course Cards

Course cards are created when students are admitted to the school.

They follow the study plan, and the relevant students are connected to the appropriate course cards so that they can see their entire study plan on the learning platform.

If four students are studying the same course with the same start and end dates, all four students should be connected to the same course card together with the teacher responsible for the course.

The following information should be displayed:

- Course name
- Course start date
- Course end date
- Study period
- Number of weeks

Could this process be automated so that the platform automatically creates course cards based on the templates and the start/end-date information?

Inactive Students

According to the municipalities' procedural guidelines, we have certain requirements concerning student activity.

- If a student has not logged in during the first five days, a withdrawal must take place.

- If a student has been inactive for 14 days, a warning email should be sent informing them that their studies will be discontinued if we do not see any activity.

Today, we rely on teachers to monitor student activity. This works well for some teachers, but is sometimes forgotten by others.

The reason we want to discontinue students who are inactive is to ensure that active students receive more of our time. It also reduces unnecessary administration for students who do not intend to study, and we do not receive payment for inactive students.

We would therefore like to automate this process so that the system detects inactivity and sends notifications to teachers and administrators.

Both parties should be able to communicate regarding the student and decide what should be done.

The system should take into account:

- When the student last logged in
- Whether the student is following the planned dates for lessons
- Whether the student is completing assignments according to the schedule

In the notification, the administrator should be able to choose between:

Option 1 – Withdraw the Student Immediately

The student should be withdrawn immediately.

An email should then be sent to the student and a notification should be sent to the teacher confirming that the withdrawal has been made.

If the student is studying a course package, the withdrawal should be applied to all courses within the package.

Option 2 – Send a Warning Email

An automatic warning email should be sent to the student stating that the school will withdraw them on a specified date if no activity is detected or if the student does not contact the school.

We currently have saved email signatures/templates for this process.

Course Cards

First Page – Overview

When staff members connected to a course card open it, they should be able to see activities and write on the notice board.

Only staff should be able to write on the notice board.

Teachers normally use this area to post:

- Welcome information
- Final exam information
- Other information that everyone connected to the course card needs to see

Practice Assignments

Staff should be able to return assignments that require corrections or additional work.

We should also be able to write comments on each submitted assignment.

Some teachers prefer to write comments directly inside the assignment, while others prefer to write a comment associated with the assignment.

Students and teachers should also be able to have discussions related to a specific assignment.

Date Planning

Within each course card, teachers should be able to schedule dates for the different sections so that students have a study plan to follow when they log in.

This is currently done two weeks before the course starts.

Could the platform automatically schedule the dates whenever a new course card is created?

The idea is that teachers provide parameters for each course they teach.

The system identifies which teacher is connected to the course card and creates the schedule according to that teacher's parameters.

Teachers should be able to define how the schedule should look for:

- 5-week courses
- 10-week courses
- 20-week courses

The system should then automatically schedule the different course components based on the course start date.

Content

Administrators, as well as teachers who have been given access, should be able to see all components of the course card and quickly make changes when necessary.

It should also be possible to hide specific components from students.

Reports

This section should show how active the students connected to the course card are.

This is where information should be retrieved for processes such as student withdrawals and warning emails.

We should be able to click on a specific student within the course card to see more detailed information about what they have completed.

The report should display all components of the course card and indicate whether each component has been completed.

- Green checkmark = Completed
- Grey X = Not completed

We would also like to add a column showing when the assignment was scheduled.

Currently, we have to return to the planning section to determine whether an assignment has not been completed because it has not yet been scheduled.

Participants

Here we should be able to see all students and staff members connected to the course cards.

Users can be added or removed from this section.

However, they should also be removed automatically if:

- They receive a withdrawal
- A staff member leaves the organization

We would also like to add a column showing when the student last accessed the course card.

APL

Logbook

Instead of course cards that all students are connected to, there should be personalized learning kits.

These should be sent out when the student starts and should also be visible on the student's first page.

Activity

There should be color codes indicating whether students have fallen behind, etc.

Certificates

Study Certificate

Similar to Alvis, when we are on a student's page, there should be a button that allows us to generate our own study certificate for the student.

Diploma

This applies to students studying course packages.

When students have completed their entire course package, they should receive a notification after the course end date.

They can then click a button to generate their diploma.

The system should verify that:

- All courses have been approved
- APL has been approved

Once all requirements have been met, the system should generate and send a signed diploma to the student.

Exams and Assignments

There should be a question bank containing questions.

The platform should be able to use the question bank to generate new exams.
